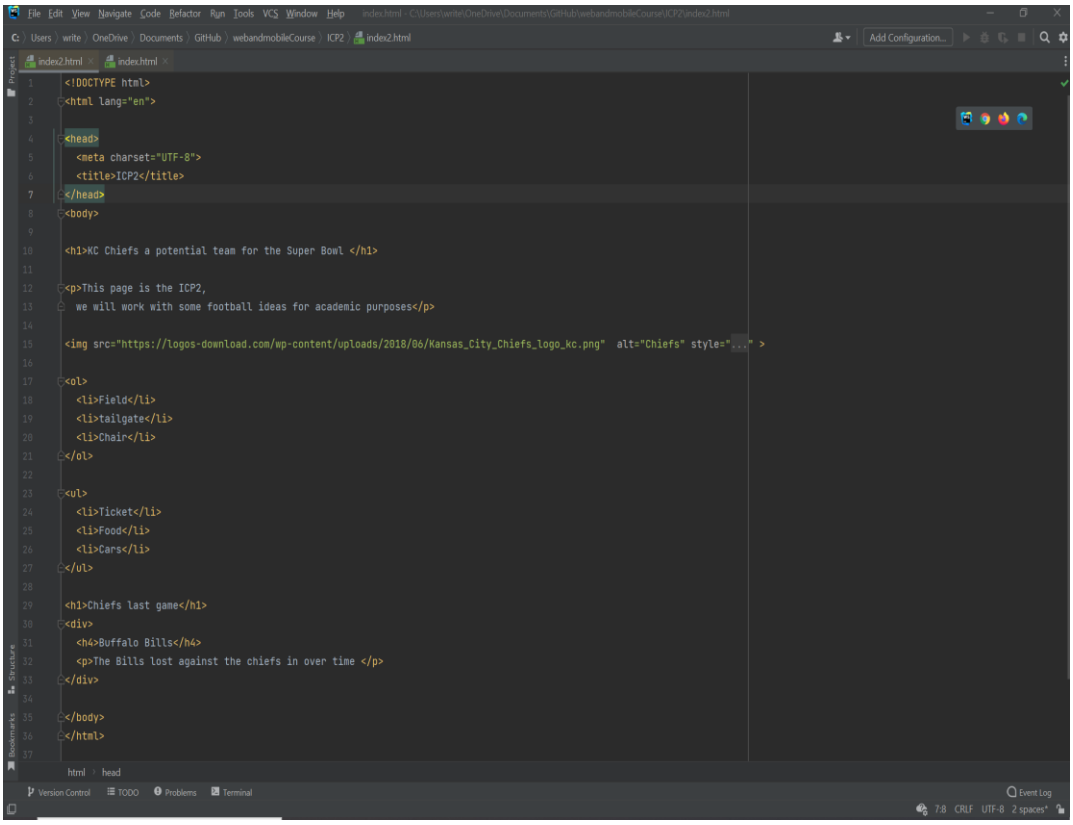
ICP2

Before I started working through the assignment, I revisited some of the concepts discuss in class about HTML. Then decided to design a page about sports choosing KC chiefs as the theme of the page. After that, I designed a basic web page using HTML, the name of my ICP is ICP2 and I used some football ideas to create it. I used WebStorm as my IDE. The process of developing this page was not hard itself I tried to keep it the simplest it could be, the website contains three headings, two paragraph, an image, a div, an order list, and an unorder list all based in HTML. In the order and unorder list I referred to concepts well known in football as tailgate is. To embed the image, I needed to use a style to define the size of the image, because when I did it at the beginning it was a humongous image that cover all the page.


Now, the complexity in this assignment was trying to figure out how to work with GitHub. Not only uploading the files but also making sure they were committed in the desktop version and then push to the cloud. As GitHub is new for me, I needed to update some files that I figure had something wrong afterwards. In this ICP I consider understanding the github structure was the most challenging part. I requires time and some practice to understand it how it works and use it properly and use it properly.
